1 Introduction

XPreview+ is a document and image viewer in the spirit of a built-in document viewer. It opens a file almost instantly, shows it page by page, lets you search, select and copy text, and can turn any file it opens into a PDF. PDFs can also be edited: fill in their forms, and rearrange, rotate, delete and combine their pages. It runs on macOS and Windows, and can be built for Linux.

1.1 What XPreview+ can open

- **PDF documents**, including password-protected ones.
- **Images**: PNG, JPEG, GIF, WebP, TIFF (including multi-page TIFF), BMP, SVG and more; HEIC on macOS. See Section 15 for the complete list.
- **Rich Text Format** (`.rtf`) documents, such as those from TextEdit, WordPad or Word.
- **OpenDocument Text** (`.odt`, `.ott`, `.fodt`) documents, such as those from LibreOffice, Google Docs or Microsoft Word.

1.2 Highlights

- **Page thumbnails** and a **table of contents** in the sidebar.
- **Export as PDF** for every file type.
- **Fill in PDF forms**: text fields, check boxes, radio buttons and lists.
- **Edit PDF pages**: drag thumbnails to reorder pages, drop other PDFs (or images and documents) into the sidebar to combine files, and rotate, delete or insert pages.
- **Search** with highlighted results, **text selection** and **copy**.
- Smooth **zooming** (including trackpad pinch), **fit to width or page**, and **rotation**.
- **Tabs**, so several documents can be open in one window.
- **Private and safe**: XPreview+ never connects to the internet on its own, never runs macros or scripts, and treats every file as potentially hostile.

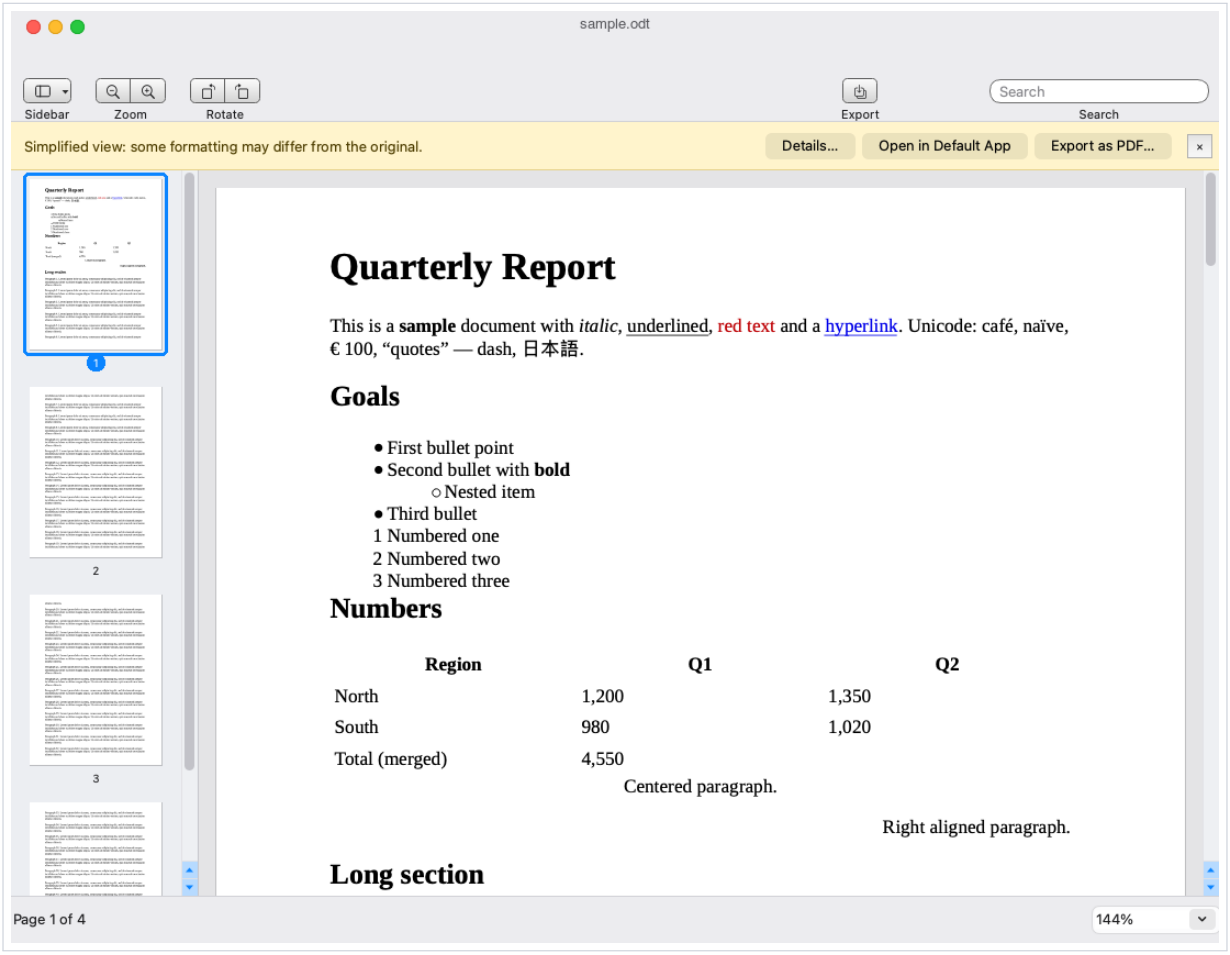

Figure 1: XPreview+ showing an OpenDocument text file, with page thumbnails in the sidebar.

2 Installing XPreview+

2.1 macOS

Requirements: a Mac with Apple silicon (M-series) and a recent version of macOS.

1. Download `XPreviewPlus-2.1-macos-arm64.dmg` from the project's Releases page.
2. Double-click the downloaded file to open it.
3. Drag the XPreview+ icon onto the Applications folder shown next to it.
4. Eject the disk image (drag it to the Trash, or click the eject button in Finder).

Opening it the first time

If the copy you downloaded is not notarised by Apple, macOS blocks it the first time you open it and shows a message that it "cannot verify" the app. To allow it:

1. Try to open XPreview+ once and close the warning.
2. Open **System Settings > Privacy & Security**.
3. Scroll down to the message about XPreview+ and click Open Anyway.
4. Confirm with your password or Touch ID.

You only need to do this once.

Removing XPreview+

Drag XPreview+ from Applications to the Trash. To also remove its settings, see Section 17.

2.2 Windows

Requirements: 64-bit Windows 10 or Windows 11.

XPreview+ for Windows is *portable*. There is no installer, and it never writes to the Windows registry.

1. Download `XPreviewPlus-2.1-windows-x64-portable.zip` from the Releases page.
2. Right-click the zip file, choose Extract All…, and pick a folder, for example your `Documents` folder or a USB stick.
3. Open the extracted `XPreview+` folder and double-click `XPreview+.exe`.

If Microsoft Defender SmartScreen shows "Windows protected your PC", click More info and then Run anyway. This appears for new applications that are not yet widely downloaded.

> **Note:** Keep all the files in the `XPreview+` folder together; the program needs them. Your settings are stored in a `settings` folder inside it. To remove XPreview+, delete the folder.

2.3 Linux

There is no ready-made Linux package yet. XPreview+ can be built from source; see the `README` in the project repository.

2.4 Checking your download (optional)

Each download on the Releases page has a matching `.sha256` file containing its checksum. To check a download, open a terminal in the folder where you saved both files and run `shasum -a 256 -c` followed by the name of the `.sha256` file (on Windows, `CertUtil -hashfile file SHA256`), and compare.

3 The XPreview+ window

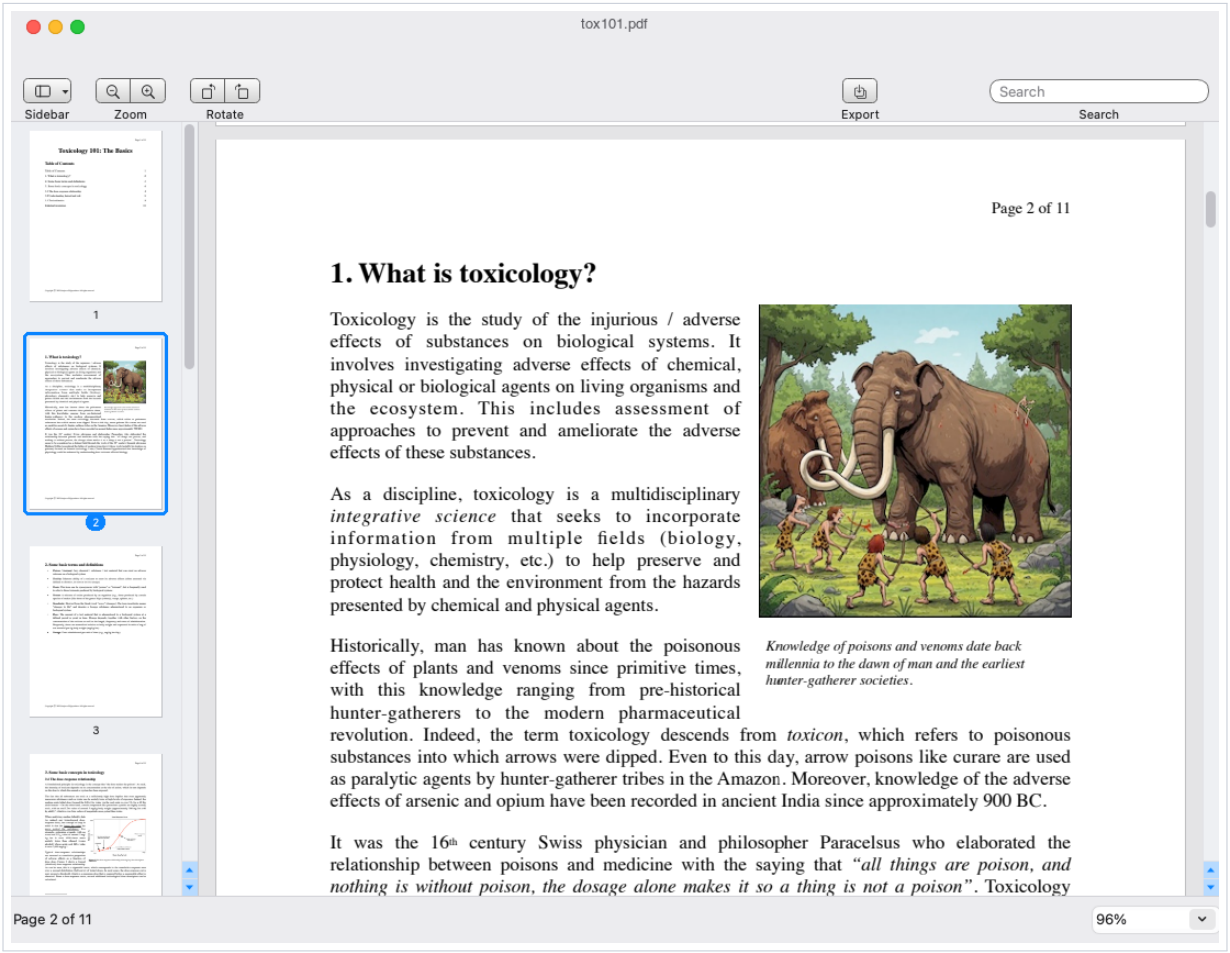

Figure 2: The main window with a PDF open. Thumbnails are on the left, the page view on the right, and the status bar along the bottom.

3.1 Toolbar

From left to right:

Sidebar button
: Click to show or hide the sidebar. Click the small arrow next to it to choose between Thumbnails and Table of Contents.

Zoom out / Zoom in
: Step the zoom down or up.

Rotate left / Rotate right
: Turn the pages a quarter turn.

Export as PDF
Save the current document as a PDF (Section 8).

Search field
Find text in the document (Section 6). The number of results appears to its left.

3.2 Sidebar

The sidebar shows either **page thumbnails** or the **table of contents**. Drag the thin divider between the sidebar and the page to make it wider or narrower; thumbnails grow and shrink with it. For PDFs, the thumbnails are also where you rearrange and combine pages (Section 10).

3.3 Page view

The main area shows the pages of your document one after another on a grey background. Scroll to move through the document.

3.4 Status bar

The left side shows the current page, for example "Page 2 of 9". For single-page files it shows the file type instead. The right side has the **zoom box**. It shows the current zoom, and you can choose Fit Width, Fit Page or a percentage from it, or type a value such as `140%` and press Return.

3.5 Information bar

For RTF and ODT documents that XPreview+ had to simplify, a yellow bar appears above the page (Section 14). For PDFs with fillable form fields, the bar says so (Section 9). Click the × button on its right to dismiss it.

3.6 Tabs

Each file you open gets its own tab. The tab bar appears as soon as two or more files are open. Click a tab to switch, drag tabs to reorder them, and click a tab's close button (or press Cmd + W) to close it.

4 Opening files

There are several ways to open a file:

- Choose **File > Open…** (Cmd + O on macOS, Ctrl + O on Windows) and select one or more files.
- **Drag** files onto the XPreview+ window.
- On macOS, drag files onto the XPreview+ icon in the **Dock**.
- In Finder, right-click a file and choose **Open With > XPreview+**.
- Choose a recently opened file from **File > Open Recent**. The list keeps the last twelve files; Clear Menu empties it.

If a file is already open, XPreview+ switches to its tab instead of opening it twice.

Tip: To have a type of file always open in XPreview+ on macOS, select such a file in Finder, choose **File > Get Info**, pick XPreview+ under Open with, and click Change All….

4.1 Password-protected PDFs

When a PDF is encrypted, XPreview+ asks for its password. All standard PDF encryption is supported, from older RC4 files to AES-256. If the password is wrong, XPreview+ says so and asks again; each further try waits a little longer. If you cancel, the tab shows a message instead of the document; close it and open the file again to retry.

Some PDFs open without a password but carry **restrictions** set by their owner: no printing, no copying, or no changes. XPreview+ honours them — the yellow bar says what is restricted, and the matching commands are unavailable. Opening the file with its *owner* password lifts the restrictions. Section 12 explains how to protect your own PDFs.

4.2 PostScript and EPS files

XPreview+ opens PostScript (`.ps`) and Encapsulated PostScript (`.eps`) files by turning them into a PDF with Ghostscript, which is included in the macOS app. EPS images are cropped to their bounding box. The converted document can be searched, copied and printed like a PDF; to keep it as a PDF, use **File > Save As…**. The original file is never changed.

Note: PostScript files are programs. Ghostscript runs them in a separate, locked-down process: it cannot use the network, start other programs, read your documents, or write anywhere except its own temporary folder, and it is stopped after a minute. On Windows, PostScript and EPS open if Ghostscript is installed.

4.3 How XPreview+ recognises files

XPreview+ looks at a file's *contents*, not just its name, to decide what it is. If a file's extension is wrong (for example an RTF document named `report.pdf`), XPreview+ still opens it correctly and notes "detected as …" in the status bar.

4.4 Files that cannot be opened

If a file is damaged, of an unsupported type, or too large to open safely, its tab shows a short explanation. OpenDocument spreadsheets (`.ods`) and presentations (`.odp`) are recognised but not supported in this version.

5 Viewing and navigating

5.1 Moving through pages

- Scroll with the trackpad, mouse wheel or scroll bar.
- Click a **thumbnail** to jump to that page. The highlighted thumbnail follows the page you are reading.
- Click an entry in the **table of contents**.
- Use the **Go** menu: Previous Page, Next Page, First Page, Last Page and Go to Page….

- On the keyboard: Space and Shift + Space move a screen down or up; Page Up / Page Down and the arrow keys scroll; Home and End go to the first and last page. When the page fits the window's width, ← and → move to the previous and next page.

5.2 Table of contents

For PDFs, the table of contents comes from the document's bookmarks. For RTF and ODT documents, XPreview+ builds it from the headings. If a document has neither, the sidebar shows "No table of contents".

5.3 Zooming

- Use the zoom buttons in the toolbar, or **View > Zoom In** / **Zoom Out**.
- **View > Actual Size** shows the page at 100%.
- **View > Zoom to Fit** fits the whole page in the window; **View > Fit Width** fits the page width. Both keep fitting as you resize the window.
- On a trackpad, **pinch** to zoom. Double-tap with two fingers to switch between fit width and a closer view.
- Hold Cmd (macOS) or Ctrl (Windows) and scroll to zoom around the pointer.
- Use the zoom box in the status bar.

Zoom ranges from 5% to 3200%. Documents open fitted to the window's width. Images open fitted to the window, but are never enlarged beyond 100%.

5.4 Rotating

Tools > Rotate Left and **Rotate Right** (Cmd + L, Cmd + R) turn all pages. Rotation only affects how the document is shown; the original file is never changed. Exported PDFs and printouts use the rotation you see.

5.5 Viewing images

When an image is larger than the window, **drag** it to move it around. **Double-click** to switch between fitting the window and actual size. Multi-page TIFF files show one page per image. Animated GIF and WebP images show their first frame.

Figure 3: An SVG image. Images are a single page and are shown at their real size if they fit.

6 Searching

1. Click the search field in the toolbar, or press Cmd + F (Ctrl + F).
2. Type the text you are looking for and press Return.

Every match is highlighted in yellow and the current one in orange. The counter next to the field shows, for example, “3 of 12”, or “Not found”.

- Press Return again, or choose **Edit > Find Next**, to go to the next match.
- Shift + Return or **Edit > Find Previous** goes back.
- Searching ignores upper and lower case.
- Clear the field (click its ×) to remove the highlights.

Note: Images have no text to search. Scanned PDFs that contain only pictures of pages cannot be searched either, because XPreview+ does not perform text recognition (OCR).

7 Selecting and copying

7.1 Text

In PDF, RTF and ODT documents, drag across text to select it; the selection is shown in blue. Then choose **Edit > Copy** (Cmd + C) to copy it. A selection covers text on one page at a time. Click anywhere or press Esc to clear it.

Tip: To move around a zoomed-in document instead of selecting text, hold Option (Alt on Windows) while you drag.

7.2 Images

When an image is open and nothing is selected, **Edit > Copy** copies the image itself, ready to paste into another application.

7.3 Links

Click a link to follow it. Web and e-mail links (`http`, `https` and `mailto`) open in your browser or mail app. Links inside a PDF jump to the page they point to. The pointer turns into a hand over a link. For safety, other kinds of links are ignored, and nothing is ever opened without a click.

8 Exporting as PDF

Any file that XPreview+ can open can be saved as a PDF.

1. Choose **File > Export as PDF…** (Shift + Cmd + E), or click the export button in the toolbar.
2. Choose a name and location. XPreview+ suggests the original name with `.pdf`, in the same folder.
3. Click Save.

A progress window appears for longer documents, and the status bar confirms when the export is done.

8.1 What you get

PDF documents
: An exact copy of the original file. If you rotated the view, the copy is saved with that rotation; if you filled in fields or edited pages, the copy includes those changes.

RTF and ODT documents
: Real PDF pages with sharp, selectable and searchable text, the same layout you see in XPreview+, and the fonts embedded.

Images
: A PDF page the size of the image, with the picture at full quality. SVG images stay sharp at any zoom.

Note: Exports are written safely: the new PDF only replaces an existing file once it has been written completely, so a failed or interrupted export never leaves a broken file behind.

9 Filling in PDF forms

Many PDFs — applications, tax forms, registration sheets — contain **form fields**. XPreview+ shows these fields with a light blue tint, and a yellow bar above the page tells you that the docu-

ment has fields to fill in.

Text fields
Click the field and type. The pointer becomes a text cursor over a text field. Use the arrow keys, Backspace and Delete as usual; drag or double-click to select text. Cmd+C, Cmd+X, Cmd+V, Cmd+A and Cmd+Z work inside the field.

Check boxes and radio buttons
Click to tick or untick. With the field selected, Space toggles it too.

Lists and pop-up menus
Click to open the list, then click a choice.

Press Tab to move to the next field on the page, and Shift+Tab to go back. Press Esc, or click anywhere outside the fields, to finish editing a field.

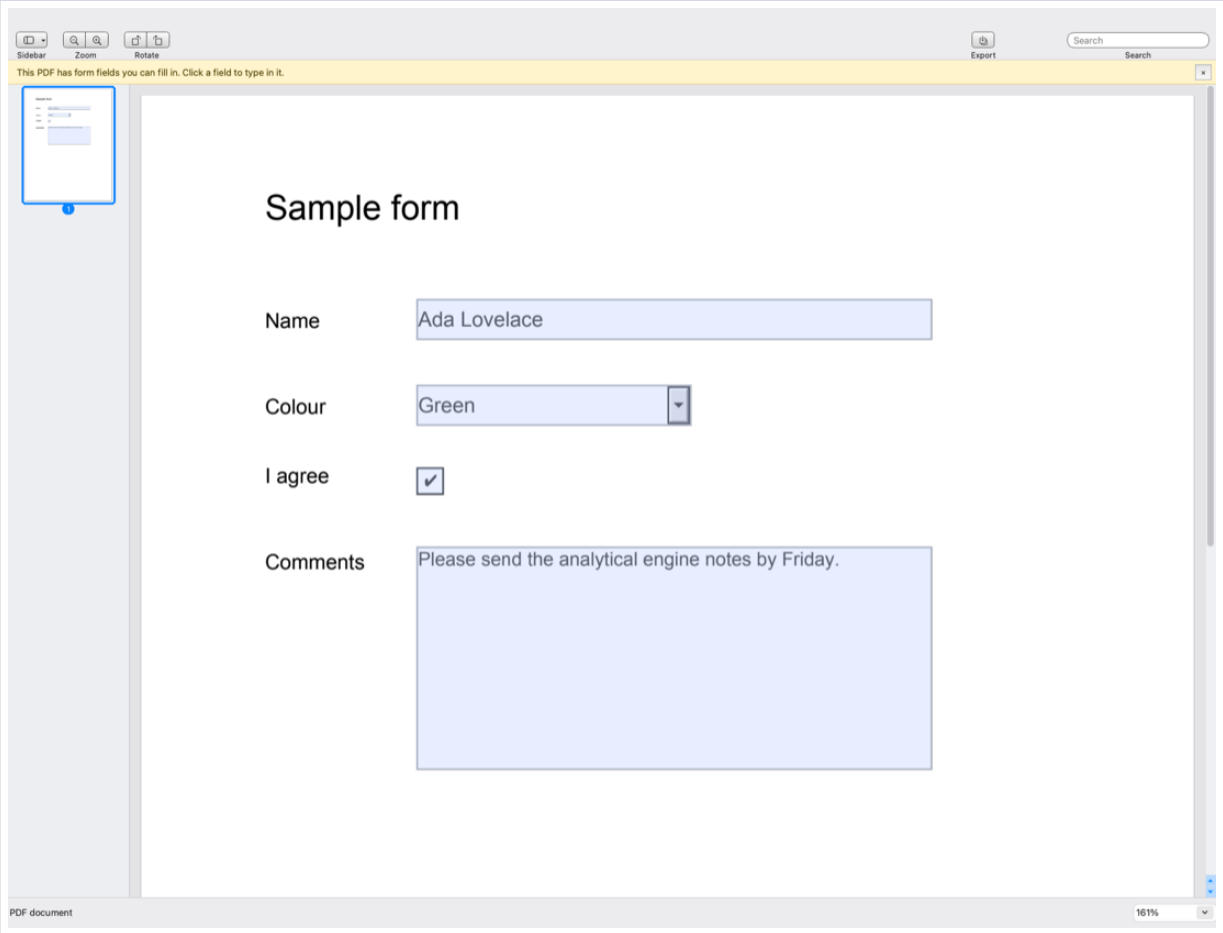

Figure 4: A PDF form being filled in. Fields have a light blue tint.

When you have filled in the form, save it (Section 11). The values are stored in the PDF itself, so any other PDF application shows them.

Note: XPreview+ never runs scripts in forms, so fields that calculate totals or check what you type in other applications do not do so in XPreview+. Digital signature fields cannot be signed.

10 Editing PDF pages

The page thumbnails of a PDF are its pages: what you change there changes the document. Click a thumbnail to select a page; Shift-click to select a range, or Cmd-click (Ctrl-click on Windows and Linux) to add single pages. The commands below act on the selected pages — or on the current page if no thumbnail is selected.

10.1 Rearranging pages

Drag one or more selected thumbnails up or down. A blue line shows where they will go; release the mouse button to move them there. Hold Option (Alt) while you drop to put a *copy* of the pages there instead.

10.2 Combining PDFs

Drag a PDF from the Finder (or Explorer) onto the thumbnails. The blue line shows where its pages will be inserted; drop it, and all of its pages are added there. You can drop several files at once. Images, PostScript, EPS, RTF and ODT documents can be dropped too: they are turned into PDF pages first, exactly as **File > Export as PDF** would.

You can also drag thumbnails from one XPreview+ window into another to copy pages between documents, or choose **Edit > Insert > Page from File…** to pick files from a dialog. The new pages go after the selected page.

> **Tip:** Dropping a file on the *page view* (rather than the thumbnails) opens it in its own tab as usual.

10.3 Rotating, deleting and adding pages

Rotate
: **Tools > Rotate Page Left** or **Rotate Page Right** (Shift+Cmd+L / Shift+Cmd+R) turns the selected pages and is saved with the document. (**Rotate Left** and **Rotate Right**, without "Page", only turn your view of the whole document.)

Delete
: Press Delete or Backspace in the thumbnails, or choose **Edit > Delete Page**. A PDF must keep at least one page.

Blank page
: **Edit > Insert > Blank Page** adds an empty page, the same size as the current one, after it.

Export pages
: **Tools > Export Selected Pages…** saves just the selected pages as a new PDF.

All of these are also in the menu that appears when you right-click (or Ctrl-click) a thumbnail.

10.4 Undo

Edit > Undo (Cmd+Z) takes back the last page change, and **Edit > Redo** (Shift+Cmd+Z) puts it back. The menu names the change, for example **Undo Move Page**. The last 20 page changes can be undone.

Note: When you combine PDFs, the pages you insert keep their look, but form fields on them can no longer be filled in. Fill in a form before combining it with other files.

11 Saving your changes

A PDF you have changed is marked as edited: on macOS the window title ends in "— Edited" and the close button shows a dot; on Windows and Linux the title has an asterisk. The tab of an edited document shows a dot (•) after its name.

Save
: **File > Save** (Cmd + S) writes the changes into the PDF.

Save As
: **File > Save As…** (Shift + Cmd + S) writes them to a new file and leaves the original as it was. The window then shows the new file.

Export as PDF
: also includes your changes, without changing which file is open.

If you close a tab or window, or quit, with unsaved changes, XPreview+ asks whether to save them. Like exports, saving is safe: the file is only replaced once the new version has been written completely.

12 Password protection

Choose **File > Password Protection…** to protect a PDF. You can:

Require a password to open it
: Nobody can see the document without the password.

Restrict printing, copying and changes
: Others can open the PDF but not print it, copy its text, or change its pages and forms. An **owner password**, which must differ from the open password, lifts the restrictions.

The protection uses AES-256, the strongest encryption PDF offers, and takes effect when you save (**File > Save** or **Save As…**). **Export as PDF** applies it too.

When you edit and save a PDF that was already protected, XPreview+ keeps its protection as it was. To change or remove it, open the PDF with its owner password (or its only password), choose **File > Password Protection…**, then OK or Remove Protection, and save.

Note: Keep your password safe: a PDF protected with a forgotten password cannot be opened, by XPreview+ or anyone else. Restrictions are honoured by PDF applications, but are not a substitute for an open password.

13 Printing

Choose **File > Print…** (Cmd + P). In the print dialog you can pick a printer and the range of pages. Each page is scaled to fit the paper and centred, using the current rotation.

14 Document information and the “simplified view”

14.1 The Inspector

Tools > Show Inspector (Cmd + I) shows information about the open file: its type, the number of pages and details such as title, author and dates. For images it shows the dimensions and colour profile. It also lists anything that was shown in a simplified way.

14.2 Simplified view

RTF and ODT files are word-processor documents. XPreview+ contains its own renderer for them, so you do not need LibreOffice or Microsoft Word installed. It reproduces text, fonts, colours, lists, tables, images, headers and footers faithfully, but a few features are approximated. When that happens, a yellow bar says *“Simplified view: some formatting may differ from the original.”* Its buttons are:

Details…
: Lists exactly what was simplified, for example “Footnotes are shown at the end of the document” or “Font substituted: Calibri → Carlito”.

Open in Default App
: Opens the file in the application your computer normally uses for it.

Export as PDF…
: Saves the document as you see it.

File > Open in Default App is also available for any file, except one whose name does not match its contents (for example a PDF named `.hta` or `.command`): your computer picks the application by the name, so such a file could run as a program instead of opening as a document.

14.3 Fonts

Documents often use fonts that are not installed on your computer. XPreview+ includes free fonts with the same letter widths as the common Microsoft fonts, so lines and pages break in the same places as in the original:

Font in the document	Shown with
Arial, Helvetica	Arimo
Times New Roman, Times	Tinos
Courier New, Courier	Cousine
Calibri	Carlito
Cambria	Caladea

A font that is installed on your computer is always used as is.

15 Supported file types

Type	Extensions	Notes
PDF	`.pdf`	Full support, including encrypted files (RC4 and AES), forms, bookmarks and links.
PostScript, EPS	`.ps .eps .epsf .epsi`	Converted to PDF with the included Ghostscript (macOS); on Windows if Ghostscript is installed.
PNG, JPEG, BMP	`.png .jpg .jpeg .bmp`	Rotation stored in photos (EXIF) is applied automatically.
GIF, WebP	`.gif .webp`	Animated images show their first frame.
TIFF	`.tif .tiff`	Multi-page TIFF files show all pages.
SVG	`.svg .svgz`	Vector images; stay sharp at every zoom.
HEIC, JPEG 2000	`.heic .heif .jp2`	macOS only.
Other images	`.ico .icns .tga .wbmp`	
Rich Text Format	`.rtf`	Fonts, colours, lists, tables, pictures (PNG, JPEG), links, headers, footers, footnotes.
OpenDocument Text	`.odt .ott .fodt`	Styles, headings, lists, tables, images, links, headers, footers, page numbers, footnotes.
OpenDocument Spreadsheet / Presentation	`.ods .odp`	Recognised, but not supported yet.

15.1 Known limitations of the RTF and ODT renderer

- Multiple text columns are shown as a single column.
- Footnotes are collected at the end of the document rather than at the foot of each page.
- Text boxes and frames are placed in the flow of the text, near where they are anchored.
- Drawings made of shapes, embedded charts without a preview picture, and WMF/EMF pictures (common in older RTF files) appear as labelled placeholders.
- All pages use the page size of the document's first section.
- Comments are hidden. Documents with tracked changes show the final text.

16 Keyboard shortcuts

On macOS, Cmd is the Command key and Option is the Option (Alt) key.

Action	macOS	Windows / Linux
File		
Open	Cmd + O	Ctrl + O
Close tab	Cmd + W	Ctrl + W
Save (PDF)	Cmd + S	Ctrl + S

Action	macOS	Windows / Linux
Save As (PDF)	Shift + Cmd + S	Ctrl + Shift + S
Export as PDF	Shift + Cmd + E	Ctrl + Shift + E
Print	Cmd + P	Ctrl + P
Quit	Cmd + Q	Ctrl + Q on Linux; close the window on Windows
Edit		
Undo / redo	Cmd + Z / Shift + Cmd + Z	Ctrl + Z / Ctrl + Y
Copy	Cmd + C	Ctrl + C
Insert page from file	Option + Cmd + I	Ctrl + Alt + I
Insert blank page	Shift + Cmd + N	Ctrl + Shift + N
Delete selected pages	Delete in the thumbnails	Delete in the thumbnails
Find	Cmd + F	Ctrl + F
Find next	Cmd + G	F3 or Ctrl + G
Find previous	Shift + Cmd + G	Shift + F3 or Ctrl + Shift + G
View		
Hide sidebar	Option + Cmd + 1	Ctrl + Alt + 1
Thumbnails	Option + Cmd + 2	Ctrl + Alt + 2
Table of contents	Option + Cmd + 3	Ctrl + Alt + 3
Actual size	Cmd + 0	Ctrl + 0
Zoom in	Cmd + + or Cmd + =	Ctrl + +
Zoom out	Cmd + -	Ctrl + -
Zoom to fit	Cmd + 9	Ctrl + 9
Fit width	Cmd + 8	Ctrl + 8
Go		
Previous / next page	Option + Cmd + ↑ / ↓	Ctrl + Alt + ↑ / ↓
First / last page	Cmd + ↑ / Cmd + ↓	Ctrl + ↑ / Ctrl + ↓
Go to page	Option + Cmd + G	Ctrl + Alt + G
Tools		
Rotate left / right	Cmd + L / Cmd + R	Ctrl + L / Ctrl + R
Rotate page left / right	Shift + Cmd + L / R	Ctrl + Shift + L / R
Show Inspector	Cmd + I	Ctrl + I
In the page view		
Screen down / up	Space / Shift + Space	Space / Shift + Space
First / last page	Home / End	Home / End
Previous / next page (page fits width)	← / →	← / →
Clear selection	Esc	Esc

Action	macOS	Windows / Linux
Zoom around pointer	Cmd +scroll, or pinch	Ctrl +scroll
Move a zoomed document	Option +drag	Alt +drag

17 Settings and privacy

17.1 Preferences

Open XPreview+'s preferences with Cmd + , on macOS, or from **Edit > Preferences** on Windows and Linux. Changes take effect immediately. The window has three tabs:

General
: the window's look — a **Modern** flat theme in Light, Dark or Automatic (Light is the default), or a **Classic** glossy look in Blue or Gray. For Modern, Dark style chooses how it looks when dark: neutral **Graphite**, or **Dracula**, with the purple-grey colours of the popular Dracula theme (Figure 5); the scroll-bar style when using the Modern theme; and whether opening several files keeps them together in one window or gives each file its own window.

PDF
: what Actual Size (100%) shows — pages at their printed size, or one PDF point per screen pixel — whether to return to the page you were last reading, and the initial page layout.

Images
: what Actual Size (100%) shows for images — their printed size, using the resolution saved in the image, or one image pixel per screen pixel.

17.2 What XPreview+ remembers

Separately from the settings above, XPreview+ remembers:

- the list of recently opened files,
- the sidebar mode (hidden, thumbnails or table of contents),
- the window's size and position (saved as soon as you move or resize it, and used for the next window you open),
- the folder you last opened a file from.

These are stored in:

macOS
: `~/Library/Preferences/org.xpreview.XPreview.plist`

Windows (portable)
: `settings\XPreview\XPreview.ini` inside the `XPreview+` folder

Linux
: `~/.config/XPreview/XPreview.conf`

To reset XPreview+, quit it and delete that file. On macOS you can instead run `defaults delete org.xpreview.XPreview` in Terminal.

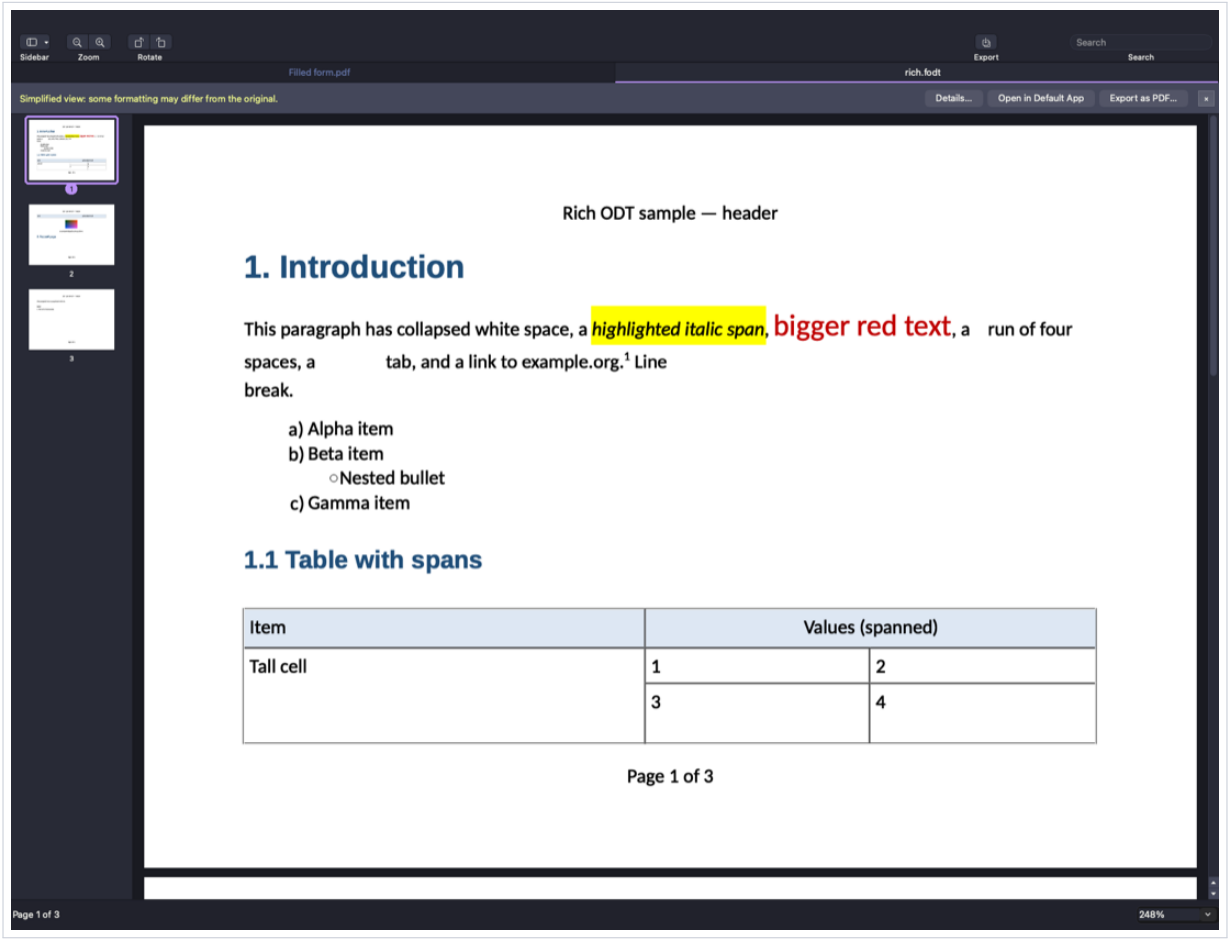

Figure 5: The Modern look with the Dracula dark style.

17.3 Privacy and safety

- XPreview+ never connects to the internet by itself. It contains no analytics, no update checks and no accounts.
- Documents cannot make XPreview+ load anything from the internet or from elsewhere on your computer. For example, pictures referenced by an SVG or ODT file but stored outside it are not loaded.
- Macros and scripts in documents are never run, including JavaScript in PDF forms.
- PostScript and EPS files are converted by Ghostscript in a sandbox with no network, no access to your files, and a time limit.
- Passwords you type are not stored or remembered.
- Links only open when you click them, and only web and e-mail links.
- Every file is treated as potentially hostile. Damaged or deliberately malformed files are handled safely and size limits stop them from exhausting memory. Such a file shows an error message instead of crashing the application.
- Exporting never changes the original file, and edits to a PDF only reach its file when you save.

18 Troubleshooting

macOS says XPreview+ cannot be opened or verified
Allow it once in **System Settings > Privacy & Security** (see Section 2.1).

Windows shows "Windows protected your PC"
Click More info, then Run anyway.

XPreview+ is missing from "Open With"
macOS adds XPreview+ to that list after it has been copied to Applications and opened once.

A document looks different from the original
For RTF and ODT files, click Details… in the yellow bar to see what was simplified. For an exact rendering, use Open in Default App.

Text cannot be found or selected
The document may be a scanned image without a text layer, or an image file.

"The file is too large to open"
XPreview+ limits very large or deeply nested files to stay safe and responsive. For example, images may be at most 30 000 pixels wide or high.

A spreadsheet or presentation does not open
OpenDocument spreadsheets and presentations are not supported yet.

HEIC photos do not open on Windows
HEIC and JPEG 2000 images are only supported on macOS.

Something else is wrong
Reset XPreview+ as described in Section 17. If the problem remains, please report it (below).

18.1 Reporting problems

Please report bugs and ask for features on the project's GitHub issues page. Include your operating system, the XPreview+ version (**Help > About XPreview+**), and, if possible, a file that shows the problem. Report **security** problems privately through the repository's Security tab instead.

19 License and credits

XPreview+ is Copyright © 2026 Sanjeeva Wijeyesakere.

XPreview+ is free software: you can redistribute it and/or modify it under the terms of the GNU Affero General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version. It is distributed in the hope that it will be useful, but **without any warranty**; without even the implied warranty of merchantability or fitness for a particular purpose. See the license for details. The full text is included with the application (`LICENSE`). The source code is available at `https://github.com/swijeyes/XPreview-Plus`.

XPreview+ is built with:

- **Qt** (LGPL-3.0), the application framework;
- **PDFium** (BSD-3-Clause / Apache-2.0), for PDF rendering;
- **miniz** (MIT), for reading OpenDocument packages;
- the **Arimo**, **Tinos** and **Cousine** fonts (Apache-2.0), and the **Carlito** and **Caladea** fonts (SIL Open Font License 1.1).

Their licenses are listed in `THIRD_PARTY_NOTICES.md` and included with the application. The XPreview+ icon was created by Sanjeeva Wijeyesakere with Google Gemini.
